

Functional & Performance Testing Template

Model Performance Test: Implementation of Client Script and UI Policy

Date: 3 October 2026

Team members: priyanka Sri J ,Abinaya R ,Monika V

Project Name:Implement Client Script & UI Policy (Incident)

Test Scenarios & Results

Test Case ID	Scenario (What to test)	Test Steps (How to test)	Expected Result	Actual Result	Pass/Fail
FT-01	Text input validation: Short Description / Caller field (Client Script onChange)	Open a new Incident form. Enter a valid short description, then enter blank/special-character-only text.	Valid text accepted; client script shows an error message and blocks submit for invalid input.	Valid text accepted; error shown for invalid input.	Pass
FT-02	Number input validation: Impact / Urgency / Priority values (Client Script onSubmit)	Select values within the allowed range (1-3), then try an out-of-range or empty value.	Valid values accepted; out-of-range value shows an error and the form is not submitted.	Valid values saved; invalid value rejected with message.	Pass
FT-03	UI Policy: make field mandatory/visible/read-only	Set Category = Hardware and check the dependent field. Change Category to another value.	Dependent field becomes mandatory and visible for Hardware; reverts to optional/hidden otherwise.	Field behavior changed as per the UI Policy condition.	Pass
FT-04	Client Script vs UI Policy execution order and conflict	Create a Client Script and a UI Policy affecting the same field. Load the form and change the field.	UI Policy applies on load; Client Script runs on its event. No conflicting behavior.	Both executed in the expected order.	Pass
FT-05	API / GlideForm connection check (g_form, g_user)	Use g_form.getValue() and g_form.showFieldMsg() in a script. Check the browser console and instance logs.	Methods respond without errors; field message displayed.	Methods responded successfully; no console errors.	Pass
PT-01	Response time test: form load with Client Script and UI Policy	Open the form 10 times and time load and field-change response with browser dev tools.	Client-side response should be under 3 seconds.	Average load approx. 1.5 s.	Pass
PT-02	Speed test: multiple GlideAjax / server calls at once	Trigger the onChange script that calls GlideAjax from several browser tabs or sessions at the same time.	Instance should not slow down; responses remain consistent.	No noticeable slowdown observed.	Pass
PT-03	Load test: attachments and bulk records (e.g., PDFs on a record)	Attach multiple PDFs to a record and create several records using the scripted form.	Should work smoothly without crashing or freezing the form.	Attachments uploaded and forms stayed responsive.	Pass
